	MM: machine model <sup>(7)</sup>	200		V
	CDM: charged device model <sup>(8)</sup>	1.5		kV

**Notes:**

<sup>(1)</sup>All voltage values, except the differential voltage, are with respect to the zero reference level (ground) of the supply voltages where the zero reference level is the midpoint between  $V_{CC}^+$  and  $V_{CC}^-$ .

<sup>(2)</sup>The magnitude of the input voltage must never exceed the magnitude of the supply voltage or 15 volts, whichever is less.

<sup>(3)</sup>Differential voltages are the non-inverting input terminal voltages with respect to the inverting input terminal.

<sup>(4)</sup>Short-circuits can cause excessive heating. Destructive dissipation can result from simultaneous short-circuits on all amplifiers.

<sup>(5)</sup>The output may be shorted to ground or to either supply. Temperature and/or supply voltages must be limited to ensure that the dissipation rating is not exceeded.

<sup>(6)</sup>Human body model: 100 pF discharged through a 1.5 kΩ resistor between two pins of the device. This is done for all couples of pin combinations with other pins floating.

<sup>(7)</sup>Machine model: a 200 pF cap is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 W). This is done for all couples of pin combinations with other pins floating.

<sup>(8)</sup>Charged device model: all pins plus package are charged together to the specified voltage and then discharged directly to the ground.
